### 3 OVERVIEW OF THE RALINK AP DEMO BOARD

#### 3.1 RT2880

The RT2880 SOC combines Ralink's 802.11n draft compliant 2T3R MAC/BBP, a high performance 266-MHz MIPS4KEc CPU core, a Gigabit Ethernet MAC and a PCI host/device, to enable a multitude of high performance, cost-effective 802.11n applications. The RT2880 has two RF companion chips: The RT2820, for 2.4G-band operation; and the RT2850, for dual band 2.4G or 5G operations. In addition to traditional AP/router applications, the chipset can be implemented as a WLAN "intelligent" NIC, drastically reducing the load on the host SOC, such as DSL/Cable or Multimedia Applications processors. Users can treat the WLAN iNIC as a simple Ethernet device for easy porting and guaranteed 802.11n WLAN performance without the need to upgrade to an expensive host SOC.

#### 3.2 RT3052

The RT3052 SOC combines Ralink's 802.11n draft compliant 2T2R MAC/BBP/RF, a high performance 384MHz MIPS24KEc CPU core, 5-port integrated 10/100 Ethernet switch/PHY, an USB OTG and a Gigabit Ethernet MAC. There are very few external components required for 2.4GHz 11n wireless products with the RT3052. It employs Ralink's 2nd generation 11n technologies for longer range and better throughput. The embedded high performance CPU can process advanced applications effortlessly, such as routing, security and VOIP. The USB port can be configured to access external storage for Digital Home applications. The RT3052 also has rich hardware interfaces (SPI/I2S/I2C/UART/GMAC) to enable many possible applications.

#### 3.3 RT3883

The RT3883 SOC combines Ralink's 802.11n draft compliant 3T3R MAC/BBP/RF, a high performance 500MHz MIPS74Kec CPU core, a Gigabit Ethernet MAC, and a USB Host/Device. With the RT3883, there are very few external components required for 2.4/5GHz 11n wireless products. The RT3883 employs Ralink 2nd generation 11n technologies for longer range and better throughput. The embedded high performance CPU can process advanced applications effortlessly, such as WI-FI data processing without overloading the host processor. In addition, the RT3883 has rich hardware interfaces (SPI/ I2S/ I2C/ PCM/ UART/ USB/ PCI/ PCIe/ RGMII/ MII) to enable many possible applications.

#### 4 AP SDK SOURCE CODE OVERVIEW

The subsequent command is used in the development environment. It makes a directory equivalent to "/home/\${user}/RT288x\_SDK".

#### #tar jxvf RT288x\_SDK\_{version}\_{date}.tar.bz2

• The RT288x\_SDK package contains the subsequent directories.

o toolchain : mips toolchain

o source : Linux kernel source

tools :useful script

• The source directory contains the subsequent directories.

o config : auto-configuration files

images : Linux imagelib : uClibc 0.9.28

o linux-2.4.x : Linux kernel source for RT2880

o linux-2.6.21.x : Linux kernel source for RT3052

o romfs : root file system (uncompressed)

tools : useful script to generate rootfs

user : user applications

vendor : init scripts of target platform (inittab, rcS...etc)

intinguiga Osymbolish Company

#### 5 TOOL-CHAIN

The Ralink AP SDK uses buildroot to make the Linux kernel image. Buildroot is a set of Makefiles and patches. It is easy to make a cross-compilation toolchain and root file system for the target Linux system. Use the uClibc C library.

#### 5.1 Install toolchain

#cp RT288x\_SDK/toolchain/buildroot-gcc342.tar.bz2 /opt

#\$ tar jxvf buildroot-gcc342.tar.bz2

The extract procedure makes a directory equivalent to "/opt/buildroot-gdb"

#### 5.2 Install LZMA Utility

Izma is necessary to make the compressed kernel image. The Ralink RT2880 SDK uses Izma to compress the kernel image.

#cd RT288x\_SDK/toolchain/lzma-4.32.0beta3

#./configure

#make

#make install (install Izma to /usr/local/bin)

Use gzip or Izma to compress the kernel image.

Make changes to RT288x\_SDK/source/vendors/Ralink/{Platform}/Makefile

COMP = gzip

Use gzip to compress the Linux kernel image.

COMP = Izma

Use Izma to compress the Linux kernel image.

#### 5.3 Install mksquashfs utility

mksquashfs-Izma is necessary to make the compressed rootfs. The Ralink AP SDK uses mksquashfs with Izma to compress the root filesystem.

#### Linux-2.4.x Kernel Version

#cd RT288x\_SDK/toolchain/mksquash\_lzma-3.0

#make

#make install (install mksquashfs-lzma to /opt/buildroot-gdb/bin/mksquashfs\_lzma-3.0)

#### Linux-2.6.21.x Kernel Version

#cd RT288x\_SDK/toolchain/mksquash\_lzma-3.2

#make

#make install (copy mksquashfs/lzma\_alone to /opt/buildroot-gdb/bin/)

LZMA\_ALONE IS NECESSARY TO MAKE YOUR OWN RAMDISK IMAGE, IF YOU TURN ON "COMPRESS RAMDISK BY LZMA" FOR RT3052.

#make menuconfig

Kernel/Library/Defaults Selection --->

Machine selection --->

[\*] Compress ramdisk by Izma instead of gzip

#### 6 BOOT LOADER

#### 6.1 Uboot Configuration

# tar jxvf Uboot\_{version}\_{BETA/FINAL}\_{date}.tar.bz2

#cd Uboot

#make menuconfig

1. Set the DRAM Size

DRAM Component:

	Row	Column
64Mb	12	8
128Mb	12	9
256Mb	13	9

DRAM Bus: 16bits / 32bits

Example:

in ingliany is only

• W9825G6EH: 4Mx4Banksx16bits SDRAM:

Row Address: A0-A12, Column address: A0-A8

DRAM Component=256Mb

O DRAM Bus =16bits

• W981216DH/W9812G6DH: 2Mx4Banksx16bits SDRAM:

o Row Address: A0-A11, Column address: A0-A8

o DRAM Component=128Mb

O DRAM Bus =16bits

• IS42S32800B: 2Mx4Banksx32bits SDRAM:

o Row Address: A0-A11, Column address: A0-A8

DRAM Component=128Mb

DRAM Bus =32bits

2. LAN/WAN Partition

The switch automatically operates in dump switch mode when the board turns on. Clients on the LAN get the dynamic IP address from the remote DHCP server connected to the WAN port.

Set the LAN/WAN partition to prevent the Client's DHCP request being sent to the WAN side.

#### 6.2 Build the uboot Image

# make

.....

NOR Flash: uboot.bin is located in Uboot/

# cp uboot.bin /tftpboot

SPI Flash: uboot.img is located in Uboot/

# cp uboot.img /tftpboot

NAND Flash: **uboot.img** is located in Uboot/

# cp uboot.img /tftpboot

#### 6.3 Burn the uboot image

Press '9' on the Uboot menuconfig, to open the invisible menu.

Set the operation:

1: Load system code to SDRAM via TFTP

2: Load system code then write to Flash via TFTP

in joshian is

- 3: Boot system code via Flash (default)
- 4: Enter boot command line interface
- 5: Load ucos code to SDRAM via TFTP

You chose 9

9: System Load Boot Loader then write to Flash via TFTP.

Warning! Erase Boot Loader in Flash then burn new one. Are you sure? (Y/N) Please Input new ones /or Ctrl-C to discard

Input device IP (10.10.10.123) ==:
Input server IP (10.10.10.99) ==:
Input Uboot filename (uboot.bin) ==:

RAITH ARBITATION OF THE PARTY O sorio di de la constanti de la

#### 7 USER LIBRARY

#### 7.1 Library Configuration

RT288x\_SDK uses ulibc 0.9.28 for user applications. The subsequent instructions show how to change the default library setting.

```
# make menuconfig
Kernel/Library/Defaults Selection --->
[*] Customize uClibc Settings
```

```
Target Architecture (mips) --->
larget Architecture Features and Options --->
Ceneral Library Settings --->
Networking Support --->
String and Stdio Support --->
Big and Tall --->
Library Installation Options --->
Clibc security related options
Clibc development/debugging options --->
Load an Alternate Configuration File
Save Configuration to an Alternate File
```

Figure 4 uClib configuration Menu

#### 7.2 Library Porting

The subsequent instructions show how to add a new library to the RT288x\_SDK.

Example: Port libtest to RT288x\_SDK

- 1. #/ cp -r libtest to RT288x\_SDK/source/lib
- modify RT288x\_SDK/source/lib/libtest/Makefile
   [you can reference to libnvram/Makefile]
- 3. modify RT288x SDK/source/lib/Makefile

```
ifeq ($(CONFIG_LIB_LIBTEST_FORCE),y)
DIRS += libtest
endif
```

intigalianosultaanilisaanilii

ifeq (\$(CONFIG\_LIB\_LIBTEST\_FORCE),y)

@\$(MAKE) -C libtest shared

endif

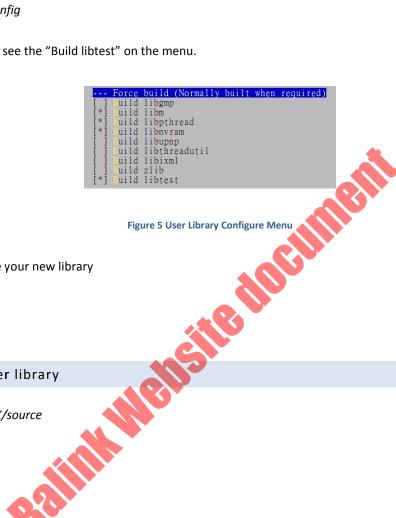

4. modify RT288x\_SDK/source/config/config.in

bool 'Build libtest'

CONFIG\_LIB\_LIBTEST\_FORCE

#/ make menuconfig

You can see the "Build libtest" on the menu.

5. Compile your new library

#make dep

#make lib\_only

#### 7.3 Build user library

# cd RT288x\_SDK/source

# make lib\_only

# make romfs

The shared libraries are shown in RT288x\_SDK /source/romfs/lib

intigation synthetical in the second synthetic second syn

#### **USER APPLICATION**

Many useful network applications (e.g. wan protocol, http server, debugging tools, etc.) are supplied with the RT288x\_SDK to make porting easier.

#### 8.1 Ralink Proprietary Applications

#### 8.1.1 ATED

Description: for rt2860 v1.4 ATE test program

Usage: ate

Note:

- Execute ate on the demo board
- Siledocina • Connect directly from the LAN port to the PC
- Execute QA on the PC (wait 30 seconds)

#### 8.1.2 REG

Description: register the read/write test program

Usage: reg [r/w/s] [offset] [value]

Note:

- To use system register: reg s 0
- To use wireless register: reg s 1 To use other base address offset: reg s [offset]
- The rt\_rdm module must be put in first

Example:

/# reg s 0

/# reg r 18 /\* read A0300018 \*/

/# reg w 18 12345678 /\* write 0x12345678 to A0300018 \*/

#### 8.1.3 FLASH

Description: flash read/write test program

Usage:

a. read: flash -r [offset(hex)] -c [num of bytes]

b. write: flash -w [offset(hex)] -o [value(hex)] -c [num of bytes]

c. erase: flash -f [first sector\_num] -l [last sector\_num

#### Example:

a. read: flash -r 370000 -c 4

b. write: flash -w 370000 -o 1234 -c 4

c. erase: flash -f 60 -l 61

#### 8.1.4 GPIO

Description: GPIO test program

Usage: GPIO [r/w/i/l]

The name of the GPIO testing user application is "gpio".

• gpio w: writing test (output)

gpio r: reading test (input)

• gpio i (<gpio>): interrupt test for GPIO number

• gpio | <gpio> <on> <off> <bli> <frests> <times>: set led on <gpio>(0~24) on/off interval, no. of blinking/resting cycles, blinking time

#### Pin sharing scheme

It is important to know what normal function pins are shared with the GPIO pins. Only one normal function and GPIO can operate at the same time.

 GPIOMODE: GPIO purpose select) Configure the pins to use as GPIO.

• PIODIR: programmed I/O direction

Configure the direction of all GPIO pins to use as GPIO. an output is set as '1', and an input pin is set as '0'.

• PIODATA: programmed I/O data

also used for adjusting GPIO data bits.

• PIOINT, PIOEDGE, PIORENA, and PIOFMASK should be set when using GPIO pins for input that causes an interruption.

.5 MII\_MGR

cription: mii register read/write test program

ge:

a. get: mii\_mgr -g -p [phy number] -r [register pumbar]

#### 8.1.5

Description: mii register read/write test program

Usage:

b. set: mii\_mgr -s -p [phy number] -r [register number] -v [0xvalue]

#### Example:

- a. get: mii\_mgr -g -p 3 -r 4
- set: mii\_mgr -s -p 4 -r 1 -v 0xff11

#### Kernel Module:

\$SDK/source/\$LINUX/drivers/net/raeth/mii\_mgr.c \$SDK/source/\$LINUX/drivers/net/raeth/ra\_ioctl.h

- IOCTL Commands
  - RAETH\_MII\_READ
    - Get phy register via the mdc/mdio interface.
  - RAETH MII WRITE
- Billing in the state of the sta • Set phy register via the mdc/mdio interface.
- IOCTL interface

typedef struct ralink\_mii\_ioctl\_data {

\_\_u32 phy\_id; \_\_u32 reg\_num;; \_\_u32 val\_in; u32 val out;

*};* 

- phy\_id: Address of PHY device
- reg num: Register addresses within PHY device
- val\_ine:
  - GET: the phy register data that is read from phy
  - SET: the current register data after MDIO setting
- Val\_out: the phy register data that wants to be set

User applications run mii\_mgr commands through the ioctl interface to the raeth driver.

8.1.6 MTD

Description: MTD writing program for firmware update

Usage: mtd\_write -r write [file] [device]

Example: mtd\_write -r write image.bin mtd4

#### 8.1.7 NVRAM

#### Description:

- a. get value in NVRAM for RT2860 or INIC platform
- b. set value in NVRAM for RT2860 or INIC platform
- c. display all configurations in NVRAM, or generate .dat files

nvram\_daemon is a daemon and register for NVRAM settings, or setting NVRAM values referring to a given file. It receives interruptions from GPIO pin 0. If SIGUSR1 is received (user one-clicked GPIO pin 0 button), nvram\_daemon tells the GoAhead web server to start the WPS PBC procedure by sending it SIGUSR1. If SIGUSR2 is received (user pressed GPIO pin 0 button for several seconds), nvram\_daemon will restore the system configuration to the default values.

#### Usage:

- a. get: nvram\_get [<2860/inic>] <field>
- b. set: nvram\_set [<2860/inic>] <field>
- c. init: ralink\_init <command> [<platform>] [<file>]

#### Commands:

- rt2860 nvram show (display rt2860 values in nvram)
- inic\_nvram\_show (display inic values in nvram)
- show (display values in nvram for <platform>)
- gen (generate config file from nvram for <platform>)
- renew (replace nyram values for <platform> with <file>)

#### Platform:

- 2860 rt2860 station
- inic intelligent nic

File: File name for renew command

daemon: nvram\_daemon

Example:

and Controlling 1150 Daily

a. nvram\_get 2860 SSID /\* get the SSID \*/

/\* set the SSID to ralink \*/ b. nvram\_set 2860 SSID ralink

/\* generate the RT2860 .dat file from NVRAM \*/ c. ralink\_init gen 2860 d. ralink\_init show inic /\* display the INIC configurations in NVRAM \*/

e. ralink\_init renew 2860 ra.dat /\* set NVRAM values for RT2860 platform according to ra.dat file \*/

/\* start the nvram daemon \*/ nvram daemon

#### 8.1.8 SPICMD

Description: SPI Toolkit for SPI EEPROM Read/Write Program...

Usage: spicmd read/write parameters

Note:

spicmd read the address

• spicmd writes the size address value

• size is 1, 2, 4 bytes

#### 8.1.9 I2CCMD

Siledalina Description: I2C Toolkit for EEPROM Read/Write via I2C Interface...

Usage: i2ccmd read/write parameters

Note:

• i2ccmd read the address

• i2ccmd write the size address value

• size is 1, 2, 4 bytes

#### 8.1.10 Script

Description: WebUI configuration script. Usage: Refer to the script help message.

#### 8.2 goahead

Source code: RT288x\_SDK/source/user/goahead/

Description: WebUI reference design of the AP/Router Solution.

#### 8.3 nvram library

Source code: RT288x SDK/source/lib/libnvram

Description: Library for nvram\_get, nvram\_set and ralink\_init.

#### 8.4 wsc\_upnp

Source code: RT288x\_SDK/source/user/WSC\_UPNP

Description: Ralink WPS (Wi-Fi Protected Setup) UPNP Daemon

Required library: libupnp, pthread

#### 8.5 iptables

Source code:

RT288x\_SDK/source/user/iptables # for Linux-2.4 RT288x\_SDK/source/user/ iptables-1.4.0rc1 #for Linux-2.6

Description: Administration tool for IPv4 packet filtering and NAT.

### 8.6 ntpclient

Source code: RT288x\_SDK/source/user/ntpclient

Description: ntpclient is an NTP (RFC-1305) client for Unix-like computers. Its functionality is a small subset of xntpd, but it appears to perform better (or at least has the ability to function better) within that limited scope. It is much smaller than xntpd and is more applicable to embedded computers.

#### 8.7 mtd-utils

Source code: RT288x\_SDK/source/user/ mtd-utils

Description: for jffs2 file system support erase/format...etc. example: mkfs.jffs2, erase, eraseall

#### 8.8 ppp-2.4.2

Source code: RT288x\_SDK/source/user/ppp-2.4.2

Description: a package which uses the Point-to-Point Protocol (PPP) to supply Internet connections over serial

lines.

#### 8.9 bridge-utils

Source code: RT288x\_SDK/source/user/ bridge-utils

Description: brctl is used to set up, maintain, and inspect the Ethernet bridge configuration in the Linux kernel.

An Ethernet bridge is a device commonly used to connect different networks of the Ethernet together, so that the Ethernets will appear as one Ethernet to the participants. Each of the Ethernets being connected corresponds to one physical interface in the bridge. These individual Ethernets are bundled into one bigger ('logical') Ethernet. This bigger Ethernet corresponds to the bridge network interface.

#### 8.10 wireless\_tools

Source code: RT288x\_SDK/source/user/ wireless\_tools

Description: This package contains the Wireless tools. The wireless tools are used to control the Wireless

Extensions. The Wireless Extensions is an interface that lets you set the Wireless LAN specific parameters and

get the specific stats.

#### 8.11 inadyn

Source code: RT288x\_SDK/source/user/ inadyn

Description: INADYN is a dynamic DNS client. It maintains the IP address of a host name. It periodically checks

if the IP address stored by the DNS server is the real current address of the machine that is running INADYN

#### 8.12 zebra-0.95a\_ripd

Source code: RT288x\_SDK/source/user/ zebra-0.95a\_ripd

Description: GNU Zebra is free software that manages various IPv4 and IPv6 routing protocols. Currently GNU

Zebra supports BGP4, BGP4+, OSPFv2, OSPFv3, RIPv1, RIPv2, and RIPng.

#### 8.13 wpa\_supplicant-0.5.7

Source code: RT288x\_SDK/source/user/ wpa\_supplicant-0.5.7

Description: WPA Supplicant (Supported WPA/IEEE 802.11i)

#### 8.14 totd-1.5

Source code: RT288x\_SDK/source/user/totd-1.5

Description: Totd is a small DNS proxy nameserver that supports IPv6 only hosts/networks that communicate with the IPv4 world using some translation mechanism.

#### 8.15 samba-3.0.2

Source code: RT288x\_SDK/source/user/ samba-3.0.2

Description: Samba is an Open Source/Free Software suite that has, since 1992, provided file and print services to all manner of SMB/CIFS clients, including the numerous versions of Microsoft Windows operating systems.

Samba is freely available under the GNU General Public License.

#### 8.16 radvd-1.0

Source code: RT288x\_SDK/source/user/ radvd-1.0

Description: The router advertisement daemon (radvd) is run by Linux or BSD systems acting as IPv6 routers. It sends Router Advertisement messages, specified by RFC 2461, to a local Ethernet LAN periodically and when requested by a node sending a Router Solicitation message. These messages are required for IPv6 stateless auto configuration.

#### 8.17 pptp-client

Source code: RT288x\_SDK/source/user/ pptp-client

Description: pptp is an implementation of the PPTP protocol for Linux and other Unix systems.

#### 8.18 rp-l2tp-0.4

Source code: RT288x\_SDK/source/user/ rp-l2tp-0.4

Description: This is a user-space implementation of L2TP (RFC 2661) for Linux

#### 8.19 ctorrent-dnh3.2

Source code: RT288x\_SDK/source/user/ ctorrent-dnh3.2

Description: CTorrent is a BitTorrent Client program written in C/C++ for FreeBSD and Linux. CTorrent is fast

and small.

#### 8.20 dhcp6

Source code: RT288x\_SDK/source/user/ dhcp6

Description: DHCPv6 is a stateful address auto-configuration protocol for IPv6, a counterpart to IPv6 stateless address auto-configuration protocol. It can be used independently or coexist with its counterpart protocol. This protocol uses client/server mode of operation but also provides support through a Relay Agent. It is currently being defined by IETF DHC WG. The specification is still in the draft form.

### 8.21 dnsmasq-2.40

Source code: RT288x\_SDK/source/user/ dnsmasq-2.40

Description: Dnsmasq is a lightweight, easy to configure DNS forwarder and DHCP server. It is designed to provide DNS and, optionally, DHCP, to a small network. It can serve the names of local machines which are not in the global DNS. The DHCP server integrates with the DNS server and allows machines with DHCP-allocated addresses to appear in the DNS with names configured either in each host or in a central configuration file.

Dnsmasq supports static and dynamic DHCP leases and BOOTP/TFTP for network booting of diskless machines.

#### 8.22 igmpproxy

Source code: RT288x\_SDK/source/user/ igmpproxy

Description: IGMPproxy is a simple mulitcast router for Linux that only uses the IGMP protocol.

#### 8.23 matrixssl-1.8.3

Source code: RT288x\_SDK/source/user/ matrixssl-1.8.3

Description: MatrixSSL is an embedded SSL implementation designed for small footprint applications and devices. It is an open-source software package available under the GNU license. It consists of a single library file with a simple API set that an application writer can use to secure their application.

#### 8.24 rp-pppoe-3.8

Source code: RT288x\_SDK/source/user/ rp-pppoe-3.8

Description: pppoe is a user-space redirector which permits the use of PPPoE (Point-to-Point Over Ethernet)

with Linux. PPPoE is used by many DSL service providers.

#### 8.25 usb\_modeswitch-0.9.5

Source code: RT288x\_SDK/source/user/ usb\_modeswitch-0.9.5

Description: USB\_ModeSwitch is (surprise!) a small mode switching tool for controlling "flip flop" (multiple device) USB gear. Several new USB devices (especially high-speed WAN stuff, they're expensive anyway) have their MS Windows drivers onboard; when plugged in for the first time they act like a flash storage and start installing the driver from there. After that (and on every consecutive plugging) this driver switches the mode internally, the storage device vanishes (in most cases), and a new device (like an USB modem) shows up. Some call that feature "ZeroCD".

#### 8.26 Port new user application

Example: Add hello application to /bin

(a) Create hello directory in RT288x\_SDK/source/user #mkdir RT288x\_SDK/source/use/hello

(b) Add Makefile to RT288x\_SDK/source/user/hello

toriospinality is some

```
EXEC = hello
    OBJS = hello.o
    CFLAGS +=
    all: $(EXEC)
    $(EXEC): $(OBJS)
             $(CC) $(LDFLAGS) -0 $@ $(OBJS)
    romfs:
            $(ROMFSINST) /bin/$(EXEC)
    clean:
                                          -rm -f $(EXEC) *.elf *.gdb *.o
(c) Add hello.c to RT288x_SDK/source/user/hello
   main()
   {
        printf("hello world\n");
   }
(d) Edit RT288x_SDK/source/config/config.in
    mainmenu_option next_comment
    comment 'XXX Add-on Applications
                                      CONFIG_USER_HELLO_WORLD
    bool 'hello_world'
    endmenu
(e) Edit RT288x_SDK/source/user/Makefile
    dir_$(CONFIG_USER_HELLO_WORLD)
                                          += hello
(f) Turn on hello application
   #make menuconfig
   [*] hello_world (NEW)
(g) Build new image
```

Antipantago syntago de la companya d

#make dep #make

(h) check file is correct

#cd RT288x\_SDK/source/romfs/bin

#file hello

#hello: ELF 32-bit LSB executable, MIPS, MIPS-II version 1 (SYSV), dynamically linked (uses shared libs),

### 9 LINUX KERNEL

## 9.1 Linux configuration

# cd RT288x\_SDK/source

# make menuconfig

```
Select the Product you wish to target --->
Ternel/Library/Defaults Selection --->
---
Load an Alternate Configuration File
Save Configuration to an Alternate File
```

1. Use 'Select the Product you wish to target' to set the target platform.

```
(RT2880) Ralink Products
(2M/16M) Blash/SDRAM Size
```

- 2. Use the 'Flash/SDRAM Size'
- 2M/16M: 2M Flash and 16M DRAM for pure AP solution (pass Vista basic logo and Wi-Fi certification b/g/n logo)
- 4M/16M: 4M Flash and 16M DRAM for complete AP solution, including AP, STA mode)
- 8M/32M: 8M Flash and 32M DRAM for complete AP/NAS solution, including USB applications)

#### Note:

- 1. Choose the target platform type (RT2880 or RT3052 or RT3883.)
- 2. Modify the User/Kernel Configuration or Load/Save User/Kernel Default setting.
- 3. Load the target platform setting from a file.
- 4. Save the target platform setting to a file.

Use 'Kernel/Library/Defaults Selection' to open the configuration menu. Use 'Default all settings'.

```
--- Kernel is linux-2.4.x

Cross Compiler Path: "/opt/buildroot-gdb/bin"

[ ] Default all settings (lose changes)
[ ] Customize Kernel Settings (NEW)
[ ] Customize Vendor/User Settings
[ ] Customize Busybox Settings
[ ] Customize uClibc Settings
[ ] Update Default Vendor Settings
```

Lettings'.

Lettings'.

Littings'.

Littings'.

Littings'.

3. Go out of the configuration menu and save the new kernel configuration.

The script gets all user/kernel default settings back. The subsequent message is shown after getting the default settings back.

\*\*\* End of Linux kernel configuration.

\*\*\* Check the top-level Makefile for additional configuration.

\*\*\* Next, you must run 'make dep'.

Note: The default configuration file is stored in a different file, referring to the 'Flash/DRAM size' settings. Go to RT288x SDK/source/vendors/Ralink/{RT2880/RT3052/RT3883}/config to see all the default setting files.

## 9.2 Change Flash/DRAM Size

Change the DRAM size setting using "make menuconfig" if you increase or decrease the size of DRAM.

Linux 2.4

```
(RT2880-ASIC) RT2880 Chip Type
(32M) DRAM Size
(4M) Flash Size
```

Linux 2.6

```
System type (Ralink RT3052 board) --->
Soc Hardware Type (RT3052-ASIC) --->
DRAM Size (32M) --->
Root File System Type (RootFS_in_RAM) --
```

# 9.3 Change Switch Controller in RT2880 Platform

The RT288x\_SDK supports the IC+ 175C/D switch controller on the RT2880 platform at this time. You can use 'make menuconfig' to adjust the switch controller settings.

```
#make menuconfig

Kernel/Library/Defaults Selection --->

[*] Customize Kernel Settings

Network device support --->

Ralink Driver --->
```

intigatian isantik

```
(IC+) CMAC is connected to
[*] Partition LAN/WAN on IC+
(W/LLLL) AN/WAN Partition
```

W/LLLL in the LAN/WAN Partition item means P0 is a WAN port, and LLLL/W means P4 is WAN Port. The switch is configured by the script, not the Ethernet driver. Please see config-vlan.sh in RT288x SDK/source/user/rt2880 app/ scripts.

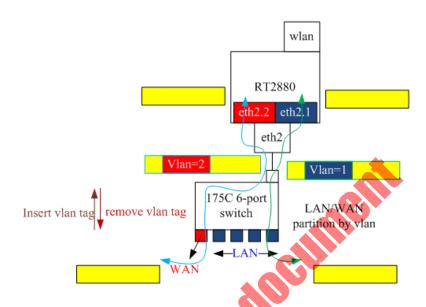

Figure 6 IC+ 10/100 Switch Operation Diagram

# 9.4 Update User/Kernel default settings

Modify the default setting if necessary. Select the 'Kernel/Library/Defaults Selection' item to enter the kernel/application configuration menu. After entering the menu, select the 'Update Default Vendor Settings' item to update the User/Kernel default settings. (Note: the new default setting will be saved in RT288x\_SDK/source/vendors/Ralink/{RT2880/RT3052/RT3883}/config)

```
--- Kernel is linux-2.4.x
ross Compiler Path: "/opt/buildroot-gdb/bin"

[ ] Lefault all settings (lose changes)
[ ] Customize Kernel Settings (NEW)
[ ] Customize Vendor/User Settings
[ ] Customize Busybox Settings
[ ] Customize uClibc Settings
[ ] Update Default Vendor Settings
```

Select "Exit" to leave the configuration menu. Select "Yes" to save the new kernel configuration.

Do you wish to save your new kernel configuration?

The script updates the User/Kernel default settings.

# 9.5 Compile Linux image

#make dep

#make

The following files in RT288x SDK/images, and \${user} ulmage will be copied to /tftpboot by default.

- a. ramdisk.gz root file system
- b. \${user}\_ulmage Linux image (Linux kernel+rootfs)
- c. zlmage.{gz/lzma} compressed Linux kernel

Note: What kinds of "make" can be used?

- a. make Linux image if you modify kernel source files
- b. make modules romfs Linux image if you modify the kernel module source files
- c. make user\_only romfs Linux image if you modify application source files
- d. You can execute "make" to generate a new image (make = make lib\_only user\_only modules romfs

  Linux image)

# 9.6 Port new Linux kernel module

Example: Port the hello networking module to the RT2880 platform

1. Add the source code to the rt2880 directory

# mkdir RT288x\_SDK/source/linux-2.4.x/drivers/net/hello

#vi RT288x\_SDK/source/linux-2.4.x/drivers/net/hello/Makefile

O\_TARGET := hello.o

obj-y := main.o

obj-m := \$(O\_TARGET)

include \$(TOPDIR)/Rules.make

#vi RT288x SDK/source/linux-2.4.x/drivers/net/hello/main.c

And County 158 Only

```
#include ux/init.h>
#include ux/module.h>
static int hello_init(void)
{
     printk("hello world\n");
     return 0;
}
static void hello_exit(void)
{
     printk("goodbye\n");
}
module_init(hello_init);

    Modify RT288x_SDK/source/linux-2.4.x/drivers/net/Makefile
    fir-$(CONFIG_RT2880_HELLO) += hello
    Modify C

module_exit(hello_exit);
MODULE_LICENSE("GPL");
```

subdir-\$(CONFIG RT2880 HELLO) += hello

3. Modify Config.in

tristate ' Ralink hello module' CONFIG\_RT2880\_HELLO

4. Turn on the hello module

#make menuconfig

Ralink hello module <M>

5. Compile the source code

#make dep

#make

Test

/# insmod hello

hello world

/#

# 9.7 Execute commands at boot up time

Edit RT288x SDK/source/vendors/Ralink/RT2880/rcS

#!/bin/sh

mount –a

goahead& <-- add new command here

### 9.8 Add new files in RootFs

If you execute the "make clean" script, it will delete RT288x\_SDK/source/romfs directory.

You cannot copy the file to RT288x\_SDK/source/romfs manually because it will disappear after executing "make clean".

Example: add xxx.bin to rootfs

- a. copy xxx.bin to RT288x\_SDK/source/vendors/Ralink/{RT2880/RT3052/RT3883}
- b. edit RT288x\_SDK/source/vendors/Ralink/{RT2880/RT3052/RT3883}/Makefile

romfs:

\$(ROMFSINST) /etc\_ro/xxx.bin

The script will copy xxx.bin to RT288x\_SDK/source/romfs/etc\_ro after executing "make romfs"

# 9.9 Image DownSize

The MTD partitions are subsequently shown.

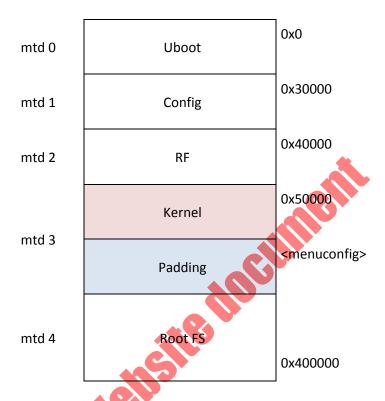

# **RootFS in RAM Mode**

mtd 0	uboot	0x0
mtd 1	config	0x30000
mtd 2	RF	0x40000

mtd 3 Kernel/RootFS 0x400000

#### **RootFS in Flash Mode**

In RootFS in Flash mode, the image builder will add a padding bit to the end of kernel image if the kernel image size is smaller than the size of mtd3. The size of mtd3 must be adjusted to save flash memory.

Step1: Check the original kernel image size (ex: 446603)

786368 /home/steven/RT288x\_SDK/source/images/zImage.lzma

# Original RootFs Size

4329746 /home/steven/RT288x\_SDK/source/romfs

# Compressed RootFs Size

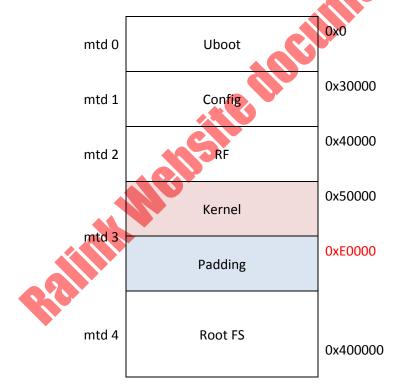

1069056 /home/steven/RT288x\_SDK/source/images/ramdisk

# Padded Kernel Image + Compressed Rootfs Size

1855424 /home/steven/RT288x\_SDK/source/images/zImage.lzma

Step2: Change mtdblock size

576110=0x8CA6E -> 0x90000 (multiple of 0x10000 because the flash sector size=64KB)

host:\$ make menuconfig

Hit 'Kernel/Library/Defaults Selection' to enter configuration menu.

And Con

Antigening of the Antiques of the Antigening of the Antiques o

# 10 FLASH LAYOUT AND FIRMWARE UPGRADE

# 10.1 Flash Layout

In the 'user configure switch parameter' partition, the WLAN0 configuration is for built-in RT2860 parameters, the WLAN1 configuration is for iNIC parameters, and the WLAN2 configuration is for RT2561 parameters. Use the free space to save your own parameters if you don't need to support iNIC or RT2561 on your product.

# 10.2 Firmware Upgrade

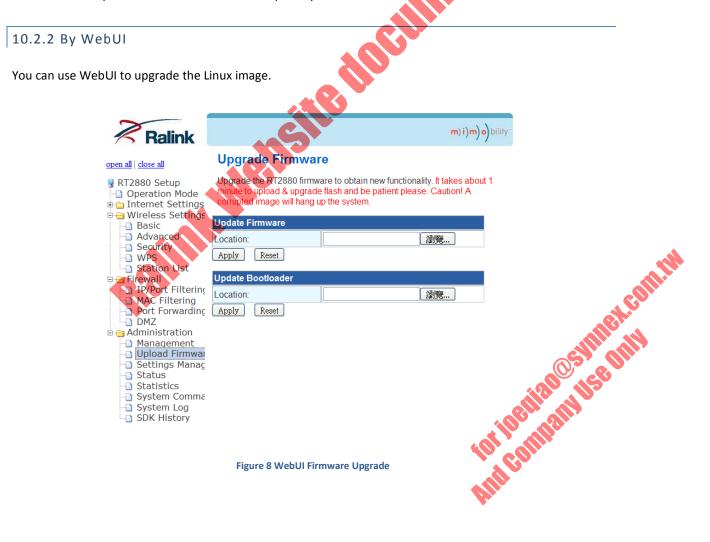

# 10.2.1 By Uboot

```
-----
Ralink UBoot Version: 2.0
ASIC 2880_MP (MAC to 100PHY Mode)
DRAM COMPONENT: 128Mbits
DRAM BUS: 32BIT
Total memory: 32Mbytes
Date:May 9 2008 Time:11:14:00
 D-CACHE set to 4 way
 I-CACHE set to 4 way
 ##### The CPU freq = 266 MHZ ####
 SDRAM bus set to 32 bit
 SDRAM size =32 Mbytes
Please choose the operation:

    Load system code to SDRAM via TFTP.

   2: Load system code then write to Flash via TFTP.
3: Boot system code via Flash (default).
   4: Entr boot command line interface.
   5: Load ucos code to SDRAM via TFTP.
```

- 1. Select option 2 on the UBoot menu to burn the Linux image from 0x50000 to 0x400000.
- 2. Select option 9 on the Uboot menu to update your uboot from 0x0 to 0x30000.

CGI uses the mtd\_write command to burn a Linux image.

- File system in RAM Burn Linux image to mtdblock3 (Kernel)
- File system in Flash Burn first x bytes to mtdblock3, and others to mtdblock4 (ps. X byes = MTTD kernel partition size in "make menuconfig"

(RT2880-ASIC) RT2880 Chip Type
(32M) RAM Size
(4M) lash Size
(RootFS\_in\_Flash) RT2880 Root File System
(B0000) MTD Kernel Partition Size (Unit:Bytes) (NEW)

And Contract USB Original

# 11.2 System requirements for the host platform

RT2880 SDK uses Fedora 6 Host to build the image. Change your Linux distribution if you cannot successfully build the image.

**Table 7 Requirements of Host Platform** 

Item	Value
Linux Distribution	Fedora 6
Kernel version	2.6.18-1.2798.fc6
RAM	512MB
HD	40G

## 11.3 How to add new default parameter in flash

There are four default settings In RT288x SDK/source/vendors/Ralink/RT2880, based on different platforms.

- RT2860\_default\_vlan: IC+ ( gateway mode)/Vitesse Platform
- RT2860 default novlan: IC+ (bridge mode)/Marvell 1000 Phy platform
- RT2860\_default\_oneport: IC+ 100 Phy platform
- RT2561\_default: RT2561 PCI NIC (RT2860+RT2561 concurrent)

# 11.3.1 Example 1

Add a new default parameter - WHOAMI for IC+ platform

1. Edit RT288x\_SDK/source/vendors/Ralink/RT2880/ RT2860\_default\_vlan, and add the following line.

#### WHOAMI=steven

2. Push "wps/load default" button or execute the following commands

#ralink init clear 2860

#### #reboot

3. Use nvram\_get to retrieve WHOAMI parameter in script file (RT288x\_SDK/source/user/rt2880\_app/scripts), or nvram\_bufset, nvram\_bufget, nvram\_commit in your CGI(RT288x\_SDK/source/user/goahead/src) to use your feature.

### 11.3.2 Example 2

Save the RADIO ON/OFF button in WebUI to flash:

#### RadioOn=1

```
2. Modify RT288x_SDK/source/user/goahead/src/wireless.c, function wirelessBasic() to save the radio on/off value to flash:

radio = websGetVar(wp, T("radiohiddenButton"), T("2"));

if (!strncmp(radio, "0", 2)) {

nvram_bufset(RT2860_NVRAM, "RadioOn", radio);
```

```
doSystem("ifconfig ra0 down");
     websRedirect(wp, "wireless/basic.asp");
     return;
}
else if (!strncmp(radio, "1", 2)) {
     nvram bufset(RT2860 NVRAM, "RadioOn", radio);
     doSystem("ifconfig ra0 up");
     websRedirect(wp, "wireless/basic.asp");
     return;
}
```

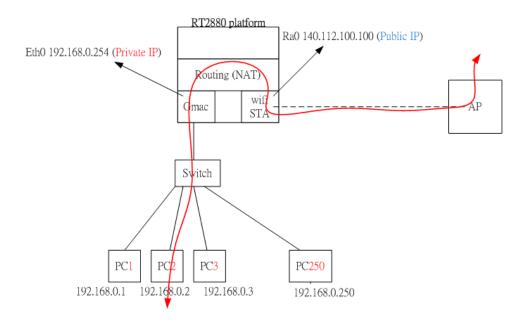

Modify the RT288x SDK/source/user/rt2880 app/scripts/internet.sh script not to bring ra0 up if RadioOn value stored in flash is not 1. Change "ifconfig ra0 0.0.0.0" to...

```
radio=`nvram_get 2860 RadioOn`
if [ "$radio" = "1" ]
          ifconfig ra0 0.0.0.0 up
else
```

fi

The Wi-Fi Interface on the RT2880 platform should be configured for STA mode. All PCs under the RT2880 GMAC port connect to the AP via the RT2880 platform.

**Figure 9 Ethernet Converter Operation Diagram** 

If the RT2880 platform can be operated as an AP or Ethernet converter by WebUI Configuration, make sure STA support and AP support as a Linux module is on in the rt2860v2 driver.

```

```

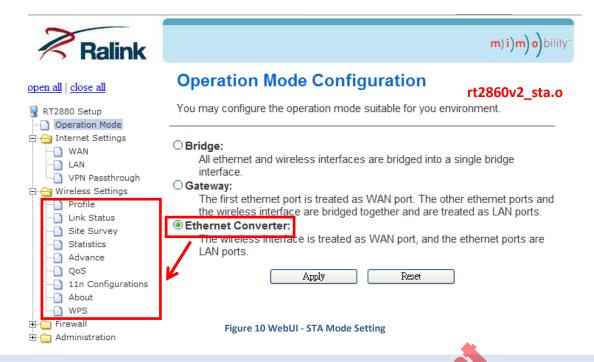

Turn on the rt2860v2 STA support if the RT2880 platform is an Ethernet converter only.

Select the operation mode on the "Operation Mode Configuration" web page.

Antigating Osympaticality

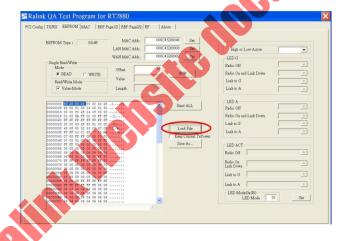

Antigating of the second second

# 11.5 Change RF chip from RT2820 to RT2850 on the RT2880 platform

The QA program can burn an RT2850 EEPROM binary file. Click the "Load File" button and choose your own EEPROM binary file. The QA program will immediately burn the binary file to flash.

11.6 How to change the Ethernet MAC address

The Ralink Ethernet driver uses GMACO\_ADDR to save its LAN/WAN mac address. If GMACO\_ADDR is empty, it will generate a random mac address instead.

#define GMACO\_ADDR (RT\_EEPROM\_BASE + 0x28)

#define GMAC1\_ADDR (RT\_EEPROM\_BASE + 0x2E)

Note: If you need the LAN/WAN Ports to have different MAC addresses, adjust the Ethernet driver to get GMACO\_ADDR for LAN, and GMAC1\_ADDR for WAN.

Use the QA program to modify your flash content.

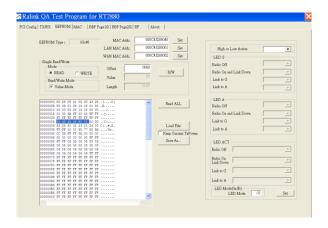

Figure 12 QA - Modify GMAC Mac address

# 11.7 How to configure GPIO ports

\$SDK/source/linux-2.4.x/drivers/char/ralink gpio.c

\$SDK/source/linux-2.4.x/drivers/char/ralink\_gpio.h

- RALINK\_GPIO\_SET\_DIR Configure the direction of the GPIO pins using bitmaps. Bit 1 is for output, and bit 0 is for input. For example, value 0x5 is for configuring GPIO pin 0 and 2 as output pins, and the other pins as input pins.
- RALINK\_GPIO\_SET\_DIR\_IN Configure one or several GPIO pins as input pins using bitmaps. For example, value 0x5 is for configuring GPIO pin 0 and 2 as input pins, and other pins are ignored.
- RALINK\_GPIO\_SET\_DIR\_OUT Configure one or several GPIO pins as output pins using bitmaps. For example, value 0x5 is for configuring GPIO pin 0 and 2 as output pins, and other pins are ignored.
- RALINK\_GPIO\_READ Read the value from the GPIO data.
- RALINK\_GPIO\_WRITE Write a value to the GPIO data.
- RALINK\_GPIO\_SET Set a value with corresponding bits on to the GPIO data. For example, value 0x5 means GPIO data bit 0 and 2 will be set to 1, and the other bits will be ignored.
- RALINK\_GPIO\_CLEAR Clear a value with corresponding bits off the GPIO data. For example, value 0x5 means GPIO data bit 0 and 2 will clear to 0, and other bits will be ignored.

- RALINK\_GPIO\_READ\_BIT Read the corresponding bit from the GPIO data. For example, bit 2 means read the third bit from GPIO data.
- RALINK\_GPIO\_WRITE\_BIT Write a corresponding bit to the GPIO data. For example, bit 2 and value 1 mean to write value 1 to the third bit of GPIO data.
- RALINK\_GPIO\_READ\_BYTE Read the corresponding byte from the GPIO data. For example, byte 2 means to read the third byte from GPIO data.
- RALINK\_GPIO\_WRITE\_BYTE Write a corresponding byte to the GPIO data. For example, byte 2 and value 0x33 mean to write value 0x33 to the third byte of the GPIO data.
- RALINK\_GPIO\_READ\_INT Same as RALINK\_GPIO\_READ.
- RALINK\_GPIO\_WRITE\_INT Same as RALINK\_GPIO\_WRITE.
- RALINK\_GPIO\_SET\_INT Same as RALINK\_GPIO\_SET.
- RALINK GPIO CLEAR INT Same as RALINK GPIO CLEAR.
- RALINK GPIO ENABLE INTP Enable GPIO input interrupt.
- RALINK\_GPIO\_DISABLE\_INT Disable GPIO input interrupt

RALINK\_GPIO\_REG\_IRQ - Register to receive an interruption from a GPIO pin. When the GPIO pin is interrupted, a signal SIGUSR1 or SIGUSR2 will be sent to the registered user process id. SIGUSR1 is sent when the GPIO pin has been clicked once, and SIGUSR2 is send when the GPIO pin has been pressed for several seconds.

# 11.8 Use GPIO to turn on LED

The Ralink SDK GPIO driver gives an interface to set the frequency of the LEDs connected to the GPIOs.

Define RALINK\_GPIO\_LED\_LOW\_ACT to 1 at \$SDK/linux-2.4.x/drivers/char/ralink\_gpio.h if the LEDs are inactive. Otherwise, define it as 0.

#make menuconfig

Kernel/Library/Defaults Selection

[\*] Customize Kernel Settings (NEW)

The LED can be set to blink in different ways if RALINK\_GPIO\_LED has been built enabled. The argument for RALINK\_GPIO\_LED\_SET is ralink\_gpio\_led\_info structure:

typedef struct {

int gpio

unsigned int on

unsigned int off

unsigned int blinks unsigned int rests; unsigned int times;

} ralink\_gpio\_led\_info;

Write the application to set the LED frequency through the ioctl interface of the GPIO device. Use the example application, gpio.

#make menuconfig

Kernel/Library/Defaults Selection --->

[\*] Customize Vendor/User Settings

Ralink RT288x Application --->

[] RT2880 GPIO Test

#### Usage:

gpio / <gpio> <on> <off> <bli> <rests> <times>

• gpio: GPIO number of the board

on: number of ticks that the LED will be brightoff: number of ticks that the LED will be dark

• blinks: number of on-offs that the LED will blink

• rests: number of on-offs that the LED will rest

• times: number of blinks before the LED stops

Note: 1 tick is equal to 100ms. The maximum number is 4000 at this time.

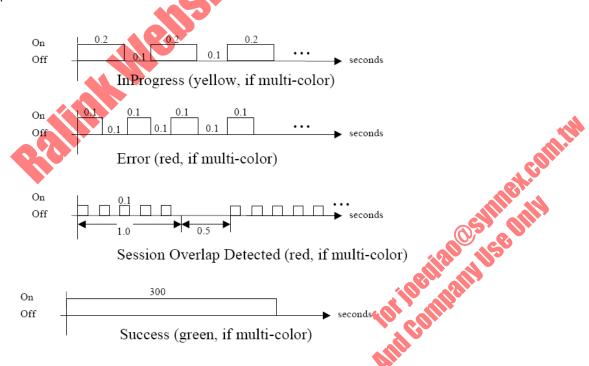

Figure 13 LED Definition of WPS Specification

Using the WPS PBC status LED as an example, the configurations would be:

- InProgress: gpio I <gpio> 2 1 4000 0 4000 (i.e. 2 ticks bright, 1 tick dark, blinking forever.)
- Error: gpio | <gpio> 1 1 4000 0 4000 (i.e. 1 tick bright, 1 tick dark, blinking forever.)
- Session Overlap Detected: gpio | <gpio> 1 1 10 5 4000 (i.e. 1 tick bright, 1 tick dark, blinking for 10 on-offs, resting for 5 on-offs, and never stops.)
- Success: gpio I <gpio> 3000 1 1 1 1 1 (i.e. 3000 ticks bright, 1 tick dark, blinking for one on-offs and one time.)
- To turn the LED on and keep it on: gpio | <gpio> 4000 0 1 0 4000
- To turn the LED off and keep it off: gpio I <gpio> 0 4000 0 1 4000

## 11.9 Use LED firmware to turn on LED

1. enable LED firmware

#make menuconfig

Kernel/Library/Defaults Selection --->

[\*] Customize Kernel Settings

Network device support --->

Ralink Driver --->

```
alink RT2860 802.11n AP support - 2860v2, (RBUS and PCI)
(RBUS)
           (WiFi Simple Config)
D (Link Layer Topology Discovery Protocol)
         LTD (Link Layer
           CLient Support
              snooping Support
```

2. Fill out flash content to control the LED behavior because the LED firmware will read the configuration from flash.

Table 11 RT2880 LED Parameters in Flash

Table 11 RT2880 LED Parameters in Flash

Address	Bit∂	LED-Mode	LED·Mode- Mode-Description⊮ Comment⊮

**Figure 14 Configuration Procedure of Telnet Server** 

#### 11.11 11n bit rate derivation

- 1. The 11n bit rate is calculated by the MAC driver. The MAC driver refers to the three subsequent factors.
  - a. MCS
  - b. BW
  - c. GI

Note: the bit rate is primarily given by the PHY layer.

- 2. Bandwidth: Data subcarriers on different bandwidths, 20MHz and 40MHz.
  - a. N<sub>SD</sub>: Number of data subcarriers.

$$N_{SD}[40Mhz] = 108$$

$$N_{SD}[20Mhz] = 52$$

$$N_{SD}[40Mhz]/N_{SD}[20MHz] = 108/52$$

$$= 2.0769230769230769230769230769231$$

b. Example:

MCS=15, 
$$GI=800$$
ns, BW=20MHz, DataRate = 130Mbps = 130 \*  $[N_{sd(40Mhz)} / N_{sd(20Mhz)}]$  = 130 \*  $[108 / 52]$  = 270Mbps

c. Please refer to "IEEE P802.11n/D2.04, June 2007" on page 314 for subsequent table.

Table 207—MCS parameters for optiona 20 MHz  $N_{SS} = 2$ ,  $N_{ES} = 1$ , EQM (#665)

MCC				V				Data rate (Mb/s)	
MCS Index	Modulation	R	R NBPSCS(iSS) NSD NSP NCBP	NCBPS	N <sub>DBPS</sub>	800 ns GI	400 ns GI See NOTE		
8	BPSK	1/2	1	52	4	104	52	13.0	14.4
9	QPSK	1/2	2	52	4	208	104	26.0	28.9

15	64-QAM	5/6	6	52	4	624	520	130.0	144.4
NOTE-T	he 400 ns GI rate	values	are rounded to 1	decima	l place				

### 3. Guard Interval:

Definition:

 $T_{sym}$ : 4 $\mu s$ 

T<sub>syms</sub>: 3.6µs

;symbol interval of Short GI.
Ratio of symbol interval on GI, refer to below EWC PHY Sepc.
Tsym / Tsyms = 4μsec / 3.6μsec = 10/9
Example:

c.

MCS=15, 40MHz Bandwidth, and 400ns Short Guard Interval.

270.0 \* (10/9) = 300.0 for Short GI.

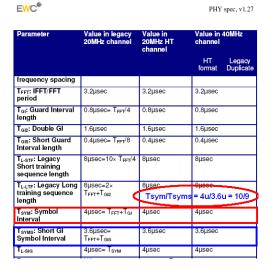

d. Reference:

> IEEE 802.11n draft 2.04, page 316 and 1)

Table 211—MCS parameters for optional 40 MHz, NSS = 2, NES = 1, EQM (#665)

PHY spec, v1.27

transmission for a period of corresponding to the length of the rest of the packet. When L-SIG TXOP Protection is not used (see "L-SIG TXOP Protection" section of the EWC MAC spec), the value to be transmitted is  $t = 3(\lceil N_{\rm data} \rceil + N_{LTF} + 3) - 3$  where  $N_{\rm data}$  is the number of **4usec** symbols in the data part of the packet. While using short GI  $N_{\rm data}$  is equal to the actual number of symbols in the data part of the packet multiplied by  $\frac{1}{20}$   $N_{LTF}$  is the number of HT training symbols. The symbol  $\lceil x \rceil$  denotes the lowest integer greater or equal to x.

# 11.12 How to build a single image for the flash programmer

Example: Make a 4M single image for the rt2880 platform (the Uboot partition is 192K, user configuration partition is 64K, and RF partition is 64K)

# RT288x SDK/tools/single ima

#vi Makefile.4M

#

# Change uboot/kernel size if necessary

#

 $UBOOT\_SIZE = 0x50000$ 

KERNEL\_SIZE = 0x3B0000

#-----

in ingliand string and some state of the sound of the sou

USER\_NAME = \$(shell whoami)

#

# Uboot Image Information

#

 $UBOOT\_DIR = .$ 

UBOOT IMAGE = uboot.bin

#

# Linux Kernel Image Information

#

 $KERNEL_DIR = .$ 

KERNEL\_IMAGE = steven\_uImage

#

# Single Image Information

#

 $PACKED_DIR = .$ 

PACKED\_IMAGE = steven\_uImage.img

#cp /tftpboot/uboot.bin .

#cp /tftpboot/steven\_ulmage

#make -f Makefile.4M

Flash layout:

-Original Uboot Image Size

149372 ./uboot.bin

- Original Kernel Image Size

2779348 ./steven\_ulmage

intigatian sylling and a second state of the second second

- Packed Image Size

4194304 ./steven\_ulmage.img

#Is -I

-rw-r--r-- 1 steven users 3831 Jun 24 19:00 Makefile.16M

-rw-r--r-- 1 steven users 2865 Jun 27 13:27 Makefile.4M

-rw-r--r-- 1 steven users 3744 Jun 24 19:00 Makefile.8M

-rw-r--r-- 1 steven users 2779348 Jun 27 13:34 steven\_ulmage

-rwxr-xr-x 1 steven users 4194304 Jun 27 13:36 steven\_ulmage.img\*

-rwxr-xr-x 1 steven users 149372 Jun 27 13:34 uboot.bin\*

The single image can now be burned using the flash programmer.

```
(rw,fmask=0000,dmask=0000,codepage=cp437,iocharset=iso8859-1)
192.168.18.21:/tftpboot on /mnt type nfs
(rw,vers=3,rsize=32768,wsize=32768,hard,nolock,proto=udp,timeo=7,retrans=3,sec=sys,addr=192.168.18.21)
```

#### 11.15 How to add a new language to the web UI

The following instructions are an example and show how to add the Korean language to the web UI.

- 1. Copy all the xml files under RT288x\_SDK/source/user/goahead/web/lang/en to RT288x SDK/source/user/goahead/web/lang/kr and translate the "msgstr" part in those files. (Note: the translation should be UTF-8 encoded)
- 2. Add an entry to RT288x\_SDK/source/config/config.in:

```
dep_bool ' language pack - Korean'
                         CONFIG_USER_GOAHEAD_LANG_KR
$CONFIG_USER_GOAHEAD_HTTPD
```

3. Add an entry toRT288x\_SDK/source/user/goahead/Makefile:

```
ifneq ("$(CONFIG USER GOAHEAD LANG KR)", "y")
  rm -rf $(ROMFSDIR)/$(ROOT_DIRECTORY)/lang/kr
endif
```

4. RT288x\_SDK/source/user/goahead/src/utils.c:

```
Add to 'getLangBuilt' function:
  else if (!strncmp(lang, "kr", 5))
#ifdef CONFIG_USER_GOAHEAD_LANG_
  return websWrite(wp, T("1"));
#else
  return websWrite(wp, I(
```

#endif

5. RT288x\_SDK/source/user/goahead/web/overview.asp

```
Add to 'initValue' function:
var lang_kr = "<% getLangBuilt("kr"); %>";
if (lang_kr == "1")
   lang_element.options[lang_element.length] = new Option('Korean', 'kr');
```

6. RT288x SDK/source/user/goahead/web/adm/management.asp

Add to 'initValue' function:

```
var lang kr = "<% getLangBuilt("kr"); %>";
if (lang_kr == "1")
   lang_element.options[lang_element.length] = new Option('Korean', 'kr');
```

Page 72 of 93

- 7. RT288x\_SDK/source/user/goahead/web/home.asp Fix 'initLanguage' function
- 8. make menuconfigCustomize Vendor/User Settings ---> Network Applications ---> select Korean language pack

### 11.20 Software QoS information

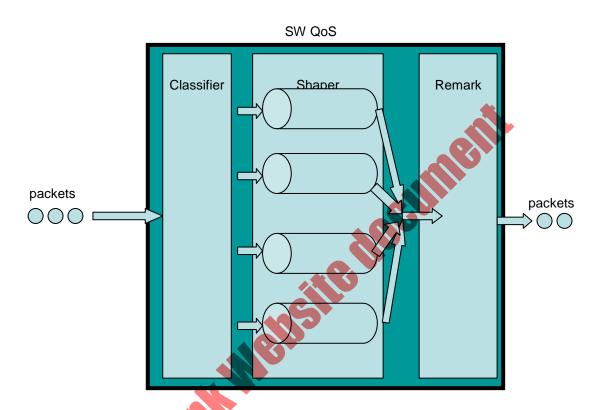

11.20.1 Software QoS - Preface

The Ralink SoC SW QoS supports many different types of classification, rate limitation, and DSCP remarking. Ralink SoC SW QoS is based on the Linux Qdiscs, TC, and iptables. Ralink SoC SW QoS only supports upload stream on a WAN interface at this time.

## 11.20.2 Software QoS - Concept

The Ralink SoC SW QoS architecture is shown in the subsequent figure. The Classifier module classifies incoming packets into the Shaper module. The Shaper module has 4 queues (groups) to do rate limitation, and then the Remark module rewrites the DSCP field of the packet if it is necessary.

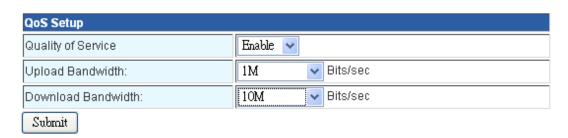

## 11.20.3 Software Qo\$ - Usage

- Select "Enable" on the web UI to enable the Software QoS.
- And County 158 Orth Enter the upload and download bandwidth details to make a good fit with the user's network environment (e.g. ADSL 512k/64k, Cable Modem 10M/10M....)

# **Quality of Service Settings**

You may setup rules to provide Quality of Service guarantees for specific applications.

4 groups would are shown after enabling QoS. Now all packets through this gateway are classified into these 4 groups according to the user's QoS rules. The 4 groups are subsequently shown.

# Quality of Service Settings

You may setup rules to provide Quality of Service guarantees for specific applications. QoS Setup Quality of Service Enable 💌 Bits/sec Upload Bandwidth: 1M Download Bandwidth: 10M Bits/sec Submit 4 Groups Group Attribute Rate:10% Modify NoName5 Ceil:100% Rate 10% Modify NoName2 Ceil:100% Rate:10% Modify IF ONE PACKET DOES NOT AGREE WITH ANY RULES, THEN THE PACKET IS CLASSIFIED INTO THE DEFAULT GROUP (THE THIRD GROUP). Default Ceil:100%

Group	Attribute
NoName5	Rate:10% Modify Ceil:100%
NoName2	Rate:10% Modify Ceil:100%
Default	Rate:10% Modify Ceil:100%
NoName1	Rate:10% Modify Ceil:100%

There are 3 attributes in every group, as shown in the subsequent figure.

a. Name: The user can define the group name.

b. Rate: Set the guaranteed minimum bandwidth that a group can use.

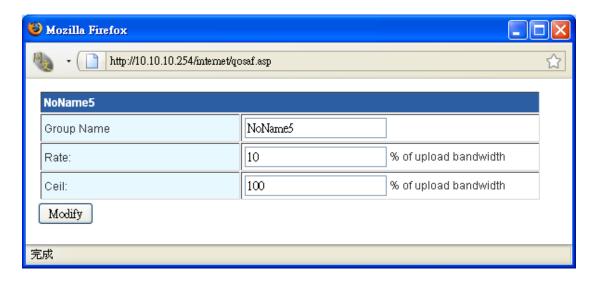

c. Ceil: Set the maximum bandwidth that a group can use.

Group	Attribute
NoName5	Rate:10% Modify
radivanies	Ceil:100%
NoName2	Rate:10% Modify
14014411162	Ceil:100%
Default	Rate:10% Modify
Deladit	Cei(1100%
NoName1	Rate/10% Modify
14014dille 1	Ceit100%

The user can press "Modify" to adjust the 3 attributes in every group.

intigatian syllaghting and a s

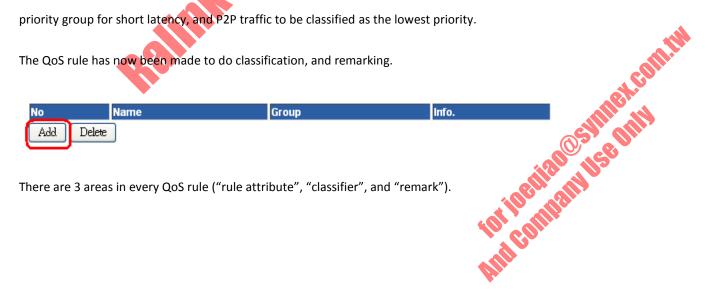

In these groups, the first group has the highest priority. The next group has the second priority, the third group is the default group. The last group has the lowest priority.

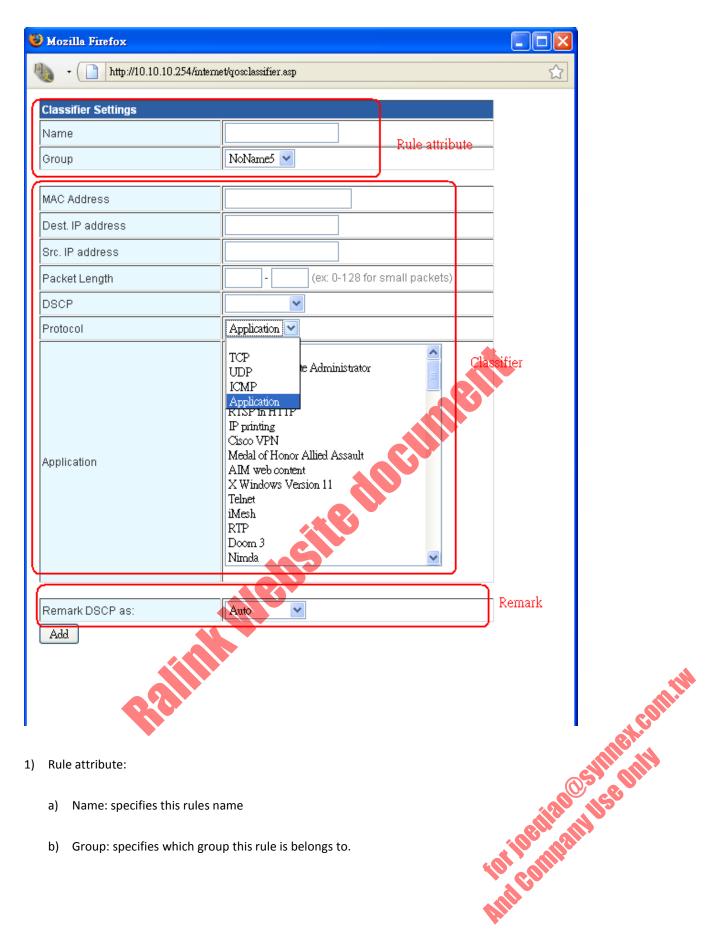

"Highest priority" means the available bandwidth will serve the group first, but rules about guaranteed rate and ceil in every group are still met. For example, people often hope VoIP traffic is classified as the highest priority group for short latency, and P2P traffic to be classified as the lowest priority.

The QoS rule has now been made to do classification, and remarking.

There are 3 areas in every QoS rule ("rule attribute", "classifier", and "remark").

Rule attribute:

Name: specifies this rules name

b) Group: specifies which group this rule is belongs to.

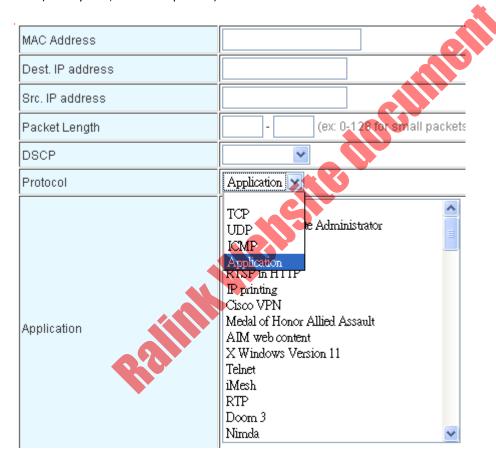

(	Classifier Settings		
	Name		Rule attribute
l	Group	NoName5 💌	Naic ampute

## 2) Classifier:

RT2880 QoS supports these classifiers at this time:

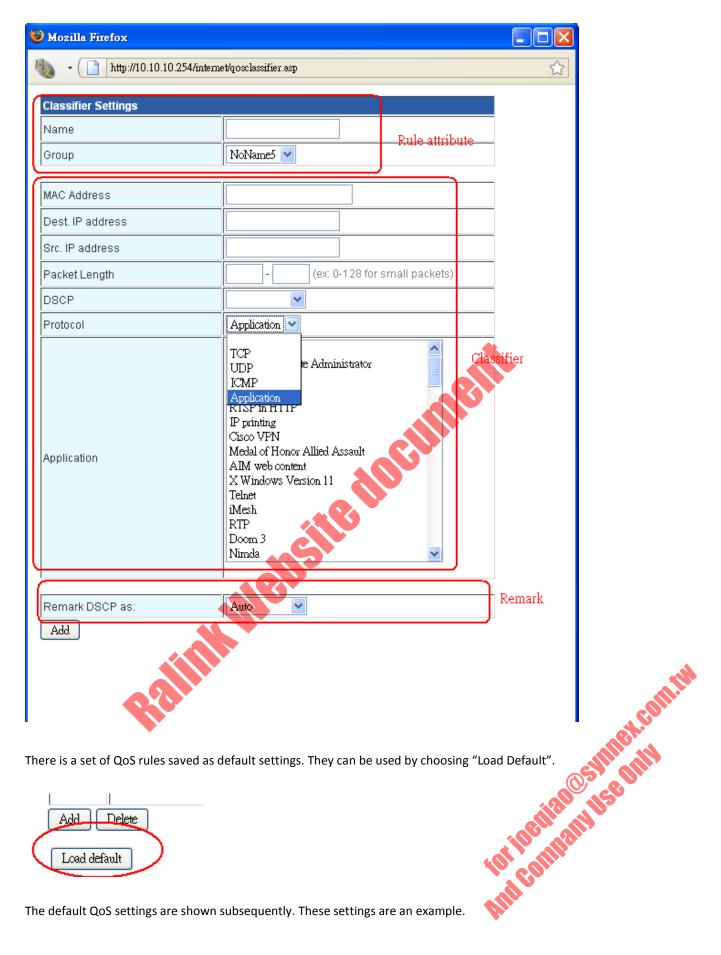

- a) SRC MAC Address
- b) SRC/DSP IP address (with netmask)
- c) Packet length
- d) DSCP field
- e) ICMP, TCP/UDP port range
- f) Layer 7 (content inspection)

## 3) Remark:

This argument specifies what DSCP value would be added to the packet as a remark which matches the rule.

There is a set of QoS rules saved as default settings. They can be used by choosing "Load Default".

The default QoS settings are shown subsequently. These settings are an example.

Group	Attribute
High	Rate:30% Modify
	Ceil:100%
Middle	Rate:20% Modify
Middle	Ceil:100%
Default	Rate:5% Modify

13 🔲	P2P_eMule_LOW	Low	Protocol: Application Application: edonkey Remark DSCP :AF11	
14 🔲	P2P_BT_LOW	Low	Protocol: Application Application: bittorrent Remark DSCP :AF11	

As shown previously, all ICMP, small packets, VoIP related, and SSH packets are classified into the highest group named "High" which has 30% minimal guaranteed bandwidth. That means all these packets share at least 30% upload bandwidth.

In this example, the left bandwidth can be evaluated after satisfying every group is 100 - 30 - 20 - 5 - 10 = 35 (%).

The 4 groups do not share (or fight for) the 35% bandwidth remaining. The design of the system recognizes the priority. In this design, the "High" group has the highest priority. After the other 3 groups are satisfied, the best case that "High" group can have is 30 + 35 = 65 (%) bandwidth. (Or 100 - 20 - 5 - 10 = 65%).

VoIP packets have the highest priority, but if someone floods ICMP packets to consume all bandwidth of the group (ICMP packets also have the highest priority), it is still possible that VoIP packets can be delayed.

Therefore, the smallest guaranteed bandwidth is per group, but not per rule.
